

# Virgin PP vs. 100% Recycled PP

## Carbon footprint

 **Product Carbon Footprint**  
= carbon footprint for a *physical product*: the production of our PP sheets

 **CO<sub>2</sub>e**  
= amount of CO<sub>2</sub> and equivalent greenhouse gasses produced *for 1 kg* extruded PP

“ **Recycled polypropylene produces 20 times less CO<sub>2</sub>e than virgin polypropylene.** ”

**Closed loop approximation method** = the method used for the calculation. In this method, we also *include the waste treatment* generated during production.
